U NOVARTIS

Anke Bill, PhD

Oncology

Basel, Switzerland

My multidisciplinary laboratory is interested in dissecting the molecular mechanisms of resistance to inhibition of MAPK signaling and to uncover novel targeting opportunities.

RAF-inhibitors have revolutionized the treatment of RAF-driven cancer types. However, a large fraction of patients still does not experience complete responses or develops resistance. My lab is investigating the function of various RAF isoforms in MAPK-signaling and is exploring the mechanisms underlying resistance to RAF-inhibitors. The unique research environment offers us a unique opportunity to combine multidisciplinary approaches, such as structural biology and protein science to understand the functional requirements for RAF activity, as well as genomic and pharmacological screens, to dissect the cellular signaling requirements. In addition, we have established collaborations with academic leaders in the field to complement our expertise and to ensure optimal progression of the project. Understanding the functional role of various RAF isoforms is anticipated to inform the design of future therapeutic strategies for targeting RAF-dependent cancers to achieve deeper and more sustained patient responses.

Selected Publications

EndoBind detects endogenous protein-protein interactions in real time.
